Persistent Data Strategy M07 A01

- (a) Item (name, description, cost, weight, n, tags) and Character (name, description, instinct, special, tags, moves, items; Monster adds hp, armor, weapon, range). These are what I am saving because I want the user to be able to make changes to these things and load them back up when they need them later. They are the core of the program and the reason the program is useful.
- (b) StorageManager as the persistence manager, called from Main. Listable and Character implement Serializable, plus ItemListUICtrl and CharacterListUICtrl using the StorageManager to save their data as it changes. This will work for now but will not scale for my project's goals, eventually I will want a better way of holding a lot of data. Also I want the tags to update as they are used in multiple places.
- (c) The GUI views: ItemListUI and ItemEditor for items, CharacterListMenu, CharacterEditor, and MonsterEditor for characters all will update as they change the lists and will persist through closing and opening the program.
